Ryan Steinwert

Unit Testing Summary for App.js and Navbar Component

Test cases completed for App.js
- Manually tested routing for relative links within website
    - Visited all routes specified in App.js, ensured correct components displayed and correctly initialized
    - Visited random routes not defined in router to test handling of erroneous links
- Manually tested links on navbar within app component routed correctly
- Manually tested getData() and updateFilter() methods by analyzing their printed return values for defects
    - Ensured these methods independent of user state
- Manually tested search functionality for a number of random and non-random queries
    - Ensured search bar usable from all pages of website
- Manually tested that Navbar links changed depending on user's authentication status

Equivalence classes
- Used dummy data in app component's state as equivalence class for item and user data stored in Firebase
